PROBLEM STATEMENT

- No remote access
- Making appointments with the doctor within the doctor's time constraint.
- Poor governance of healthcare centres
- Health care services are facing a huge challenge to meet up with the constant demand and surge of patients

About our project....

Why have we made this health care system?

Our objective.

- The healthcare system allows the user to manage their health care needs like maintaining their checkup reports, booking and managing their doctor appointments, medicines all at one place.
- Moreover, the system will also be able to read and identify the details mentioned by the doctor in his/her prescription.
- On further development, the system will also be able to answer basic health related questions that the user has.

What will our system do?

Functions we will provide...

Our system is a **Healthcare Virtual Assistant** that will help the user maintain medical records, book appointments, set medicine related reminders, all at one place using his/her phone or website.

What the user gets from our system?

- A reminder system for medicines and doctor’s visits.
- Upload and maintain medical reports and records, all at one place.
- An AI based handwriting recognition system that reads the doctor’s prescription and tells you what has been written.

Literature Review

Reviewing existing healthcare assistants..

What did we learn from existing systems?

- The Health Care assistants currently available in the market are made by companies whose main focus is the sales of their medicines or other healthcare products.
- Many apps do provide an assistant but these assistants will guide the user towards buying the companies services other than provide basic help.
- Our system being purely an health assistant, focuses more on helping the user to deal with his/her day to day medical needs like medicine doses, doctors appointments, common diseases like cold fever, etc.

Use Cases...

Tabular representation of the functions that our system performs.

Case 1: Registration Case

Use case id	registration_case
Use case name	Registration
Actor	User and server
Pre condition	Website is available, Database is available, Internet
Post condition	Registration successful
Trigger	Click on registration button when the interface launches
Scenario flow	1. Enter details 2. Confirm phone number / email 3. Click on register 4. Print registration successful
Alternate flow	1. Phone number/ email not confirmed correctly 2. Invalid personal details 3. Network issue 4. Error occurred

Case 2: Login Case

Use case id	login_case
Use case name	Login
Actor	User, Server
Pre condition	Successful registration
Post condition	Logged in successfully
Trigger	Click on login button when the interface launches
Scenario flow	1. Click on login 2. Enter password 3. Print logged in successfully
Alternate flow	1. Phone number/ email not confirmed correctly 2. Wrong password 3. Network issue 4. Invalid registration

Case 3: Set Medicines' Reminder Case

Use case id	medReminder_case
Use case name	SetMedReminder
Actor	User, server
Pre condition	Successful login
Post condition	Reminder set for the dose of the said medicine
Trigger	Click set medicines reminder button
Scenario flow	1. Click set medicines reminder 2. Enter details of medicine (name, quantity, power) 3. Select time and frequency 4. Choose mode of reminder (WA, Mail, Notif) 5. Confirm details and set 6. Print reminder set for #medName for #time for #frequency.
Alternate flow	1. Date or time selected wrong 2. Medicine details entered wrong 3. Network issue

Case 4: Set Doctor's Visit Reminder Case

Use case id	docReminder_case
Use case name	SetDocReminder
Actor	User, server
Pre condition	Successful login
Post condition	Reminder set for the said doctor's visit
Trigger	Click set doctor's visit reminder button
Scenario flow	1. Click set doctor's visit reminder 2. Enter details (name of doctor, etc) 3. Select date and time 4. Choose mode of reminder (WA, Mail, Notif) 5. Confirm details and set 6. Print reminder set for #docName's visit for #date-time
Alternate flow	1. Chosen time slot may not be empty in the calendar for the said day 2. Date and time chosen wrong 3. Network issue

Case 5: Edit Reminder Case

Use case id	editReminder_case
Use case name	editReminder
Actor	User, server
Pre condition	Reminder has to be set successfully (case 3,4)
Post condition	Reminder is edited and the changed reminder is set in the calendar
Trigger	Click edit reminder button on the particular reminder's interface
Scenario flow	1. Click edit reminder 2. Do the required changes a. Change date/time b. Change doctor/medicine c. Change dosage d. Change mode of reminder (WA, Mail, Notif) 3. Click done/confirm 4. Print #reminderName has been updated.
Alternate flow	1. No reminder has been set 2. The changed time slot not free in the calendar 3. Network issue

Case 6: Upload Report Case

Use case id	upReports_case
Use case name	uploadReports
Actor	User, server
Pre condition	Successfully logged in
Post condition	Reports uploaded successfully.
Trigger	Click upload reports
Scenario flow	1. Click upload reports button 2. Enter the date of the testing 3. Upload the pdf reports files from user device 4. Update record in database
Alternate flow	1. Not logged in 2. Invalid date 3. Files are too large 4. Network error

UML Diagrams

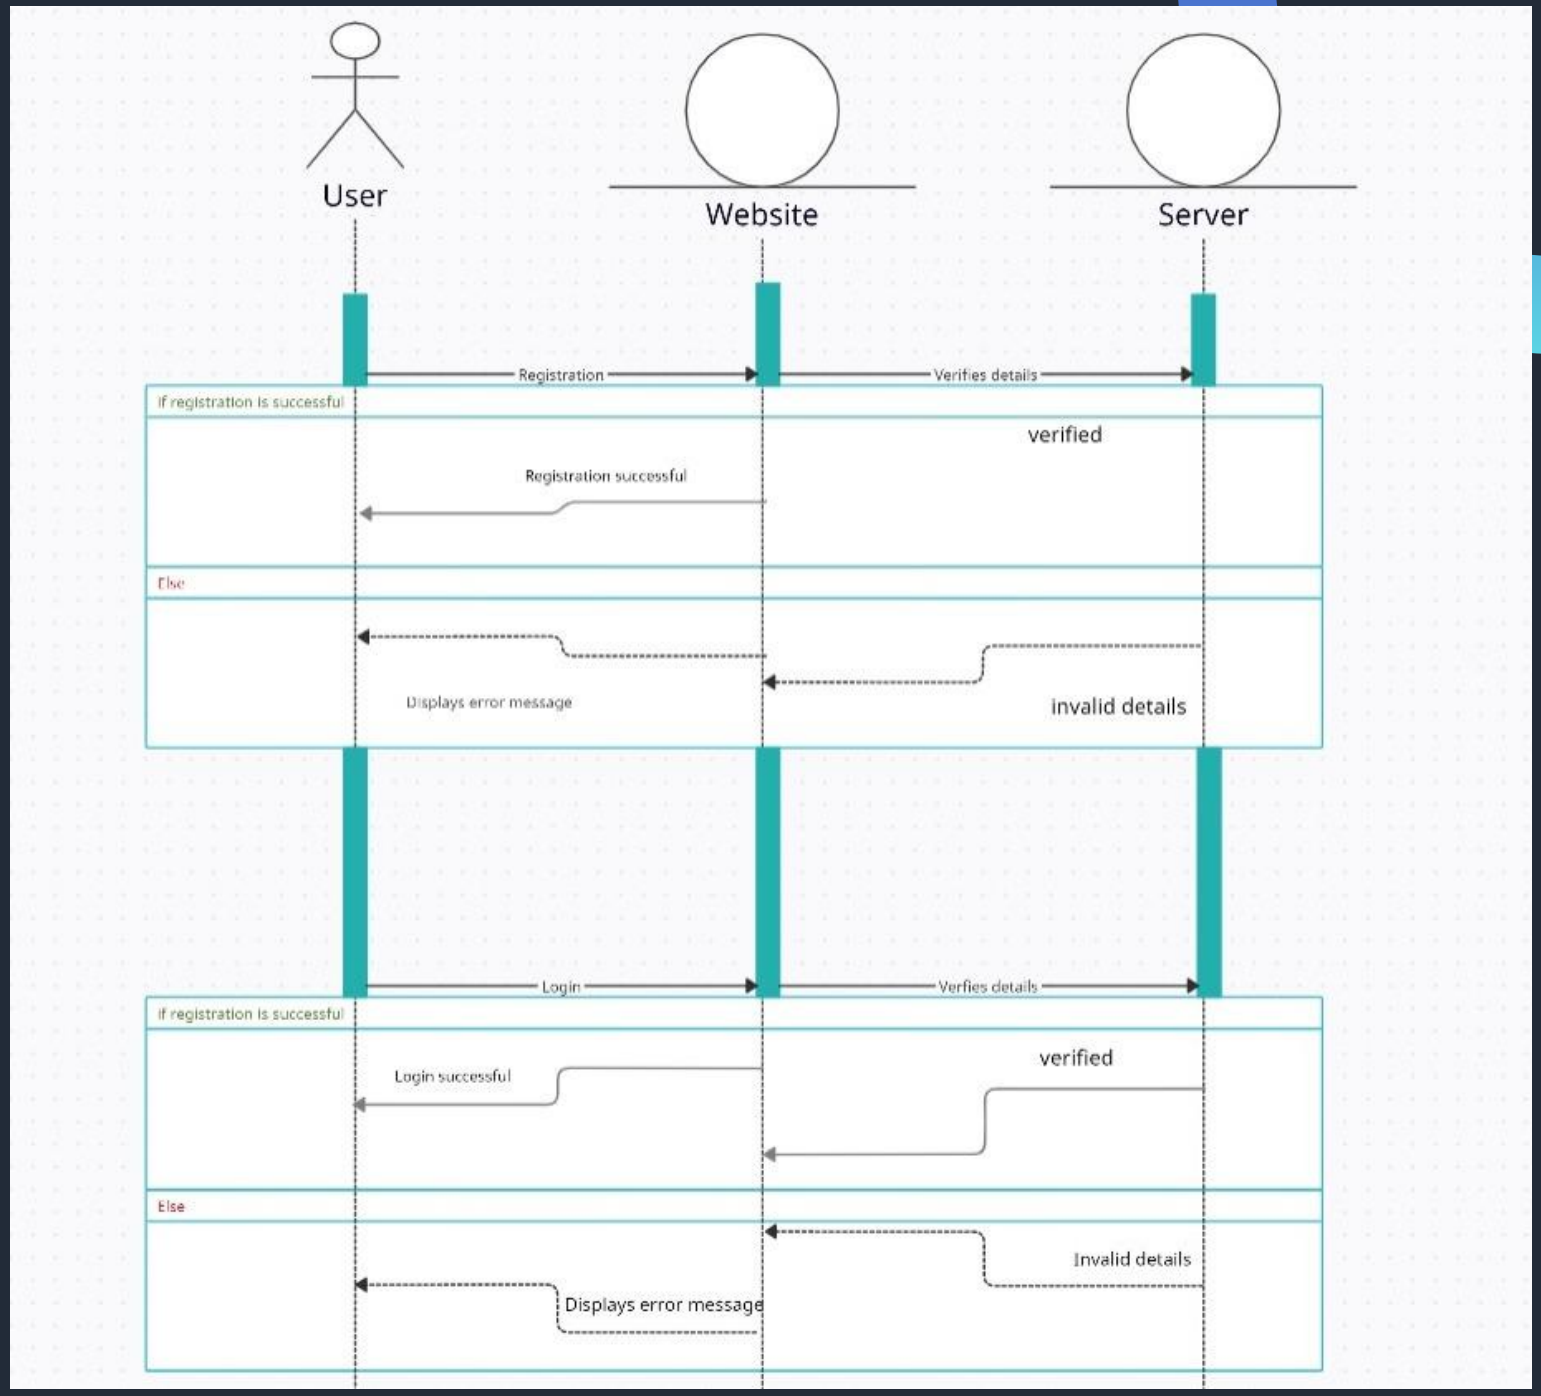
Sequential Diagram



Technology used

What have we used to create our system..

Technologies used:

- HTML, CSS, PHP for the website design and formatting.
- XAMPP for the Apache server and SQL Database.
- Dialogflow for the Chatbot development.
- Create.ly for making the UML diagrams.
